

PROFIBUS/PROFINET

TEAM : MD LIMON APU

AGENDA

- ☐ INTRODUCTION TO PROFIBUS/ PROFINET.
- ☐ PROFIBUS.
- ☐ PROFINET.
- ☐ APPLICATIONS.
- ☐ SIMULATION.
- ☐ CONCLUTION.

INTRODUCTION TO PROFIBUS/ PROFINET

PROFINET:

- Advanced industrial Ethernet-based communication protocol.
- Real-time data transfer and high-speed performance.
- Seamless integration with existing systems.

PROFIBUS:

- Established industrial communication standard.
- Reliable and versatile fieldbus technology.
- Enables seamless automation connectivity.

PROFINET

- Ethernet-based communication protocol.
- Developed by PROFIBUS & PROFINET International.
- Real-time communication for industrial Automation.
- Supports motion control, safety, energy management, and diagnostics.

PROFIBUS

- **Fieldbus communication protocol.**
- **Developed by PROFIBUS & PROFINET International.**
- **Works for different topologies such as star.**
- **Supports various device types, including sensors, actuators, controllers, and drives.**

ARCHITECTURE

PROFIBUS

- **Centralized controller (PLC) and decentralized peripherals.**
- **PROFIBUS DP for factory automation.**
- **PROFIBUS PA for process automation.**
- **Controller acts as the master, peripherals as slaves.**

PROFINET

- **Controller (PLC) and IO devices.**
- **PROFINET IO for real-time communication.**
- **PROFINET CBA for component-based automation.**
- **Flexible and scalable architecture**

DATA LAYERS

PROFIBUS

- **Physical Layer:**
 - Based on RS-485(Slow speed).
 - Transmission rates 9.6 Kbps, 12 Mbps, and 45 Mbps.
- **Data Link Layer:**
 - PROFIBUS DP and PROFIBUS PA protocol.
 - Provides error checking and correction

PROFINET

- **Physical Layer:**
 - Use Ethernet Technology(High Speed).
 - Transmission rates 10 Mbps, 100 Mbps, and 1 Gbps.
- **Data Link Layer:**
 - Ethernet II and IEEE 802.3 protocol.
 - Provide communication with a maximum cycle time of 31.25 μ s.

COMMUNICATION REQUIREMENT

■ Bandwidth:

Profibus DP can handle up to 12 Mbit/s.

Profinet up to 100 Mbit/s.

■ Latency:

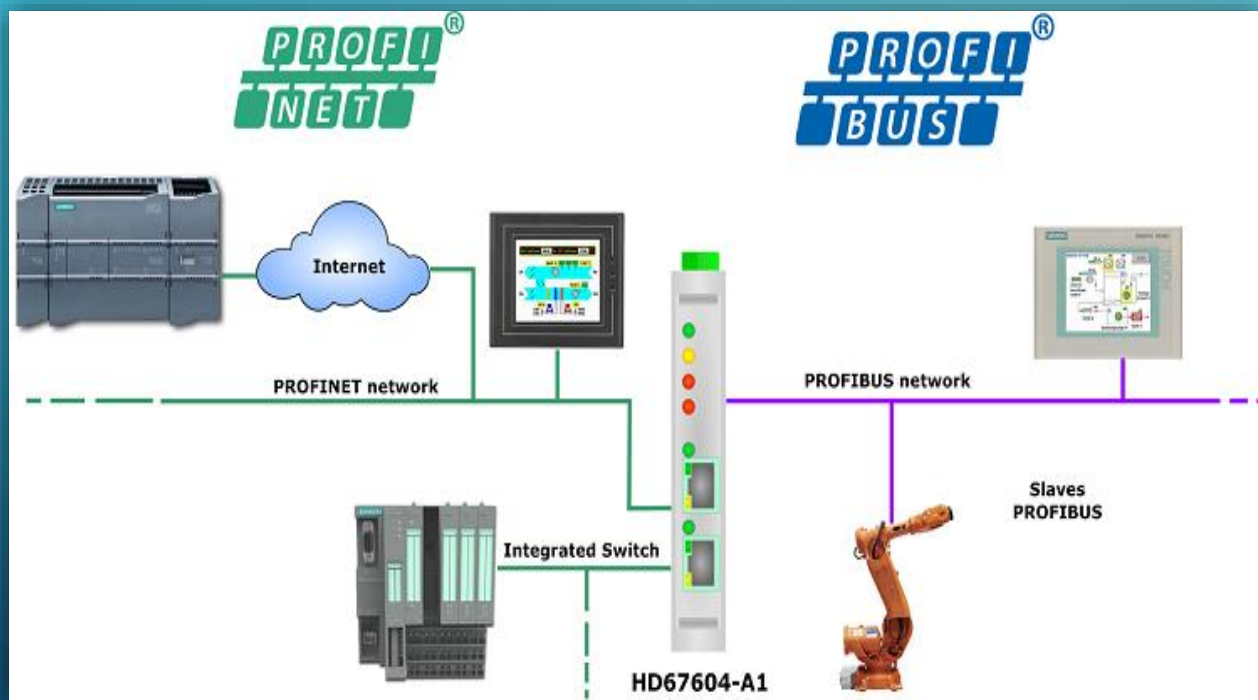

Profibus ranging from microseconds to milliseconds.

Profinet ranging from microseconds to low milliseconds.

APPLICATIONS

Manufacturing and Assembly Lines

APPLICATIONS

Bottling facilities

PROS & CONS

PROFIBUS

- **Robust and Reliable Technology.**
 - **Cost-Effective Industrial Automation Solution.**
-
- **Limited Bandwidth for Data Transmission.**
 - **Compatibility Challenges with Modern Systems.**

PROFINET

- **High-Speed Real-Time Communication.**
 - **Seamless Ethernet Integration and Interoperability.**
-
- **Complexity and Higher Setup Costs.**
 - **Vulnerability to Network Issues.**

SIMULATION(PROFIBUS)

```
import time
```

```
class PROFIBUSSlave:
    def __init__(self, address):
        self.address = address

    def process_request(self, request_data):
        if request_data == b"Hello, slave!":
            return "Hello, master {}".format(self.address).encode()
        else:
            return b"Unknown request!"
```

```
class PROFIBUSMaster:
    def __init__(self, slaves):
        self.slaves = slaves

    def send_request(self, request_data):
        responses = []
        for slave in self.slaves:
            response = slave.process_request(request_data)
            responses.append(response)
        return responses
```

SIMULATION(PROFIBUS)

```
slaves = []
for i in range(1, 6):
    slave = PROFIBUSSlave(address=i)
    slaves.append(slave)

master_device = PROFIBUSMaster(slaves=slaves)

request_data = b"Hello, slave!"
responses = master_device.send_request(request_data)

for i, response in enumerate(responses):
    print("Response from slave {}: {}".format(i + 1, response.decode()))
```

RESULTS

```
Response from slave 1: Hello, master 1!
Response from slave 2: Hello, master 2!
Response from slave 3: Hello, master 3!
Response from slave 4: Hello, master 4!
Response from slave 5: Hello, master 5!
```

THANK YOU
